NOTES

- The DMX-TUBE-4848 works by connecting a series of them in a daisy chain.
- They are manually addressed using an external addressing device (DMX-TUBE-PROG).
- The initial DMX signal is acquired by connecting one initial T cable (part number: LED-PIXEL-T-INI-DMX) which provides the main DMX signal input as well as the main 12V DC power input.
- After the initial T Cable, the subsequent cables needed to daisy chain the vert tubes are the LED-PIXEL-T-PW which do not have the DMX connector.
- It is always best to power each 3 tube line that you may have created using the vert tubes from both sides of the line using 2 power supplies (12V 200W each), this will decrease voltage drop and keep everything evenly lit.
- You can have up to 3 Vert Tubes per universe.
- After the first 3 tubes, a new universe will need to be created.
